

---

How would you like to learn one of the fastest and most efficient ways to convert your text into braille? If so, this article is for you! You will be able to print your favorite book or novel on a personal Braille printer, but there's more! You'll also learn how one can accumulate an entire library of books in just a few minutes. And if that isn't all impressive, you'll be able to enjoy movies as well as TV. This is no exaggeration; it's not some lie that we're backed up by fancy words and dubious claims. We're here to let you know the truth, and that is that you can produce braille books relatively easily. Your first step is to familiarize yourself with the braille typewriter. The next step is to make up a list of the books you want brailled. If your library of books is large or if you don't have any idea of what ones are good, start with some popular ones. A list of books includes authors, titles, names of characters, places involved in the story and anything connecting them all together which makes them one compelling tale. This will equip you with enough knowledge to produce braille books for your entire library. The next step is to purchase a service that will produce free braille books for you. Once you have a list of books and an estimated amount of time it will take, begin the process of ordering the braille books. You will need to give the author or publisher your personal info so they can be able to send it quickly and efficiently. Once you receive the package, simply print out what you need and start reading! It's as easy as pie! Your next step is to update your own personal computer with a screen reader that can convert text into braille. Find a screen reader and install it on your computer and you're all set! Your screen reader will be able to convert your text into braille for you so you can use your computer the same as you use any other. Now, if there were no video or audio, how would you watch your favorite movies and TV shows? Well, the answer is again easy. The technology has simply been applied to this process as well, so now we can watch videos on our computers. We don't have to go out of our homes to watch them anymore, which means more time spent on other things! Another amazing application of this technology is that one can make voicemail messages on their cell phones for free. Now, instead of asking someone to read you the voicemail messages, you can convert them into braille! If you don't want to do that, then send yourself an email with the message in braille. After getting your new email with your voicemail message in braille, you have three options. First, put it away on a pile of papers for later reference. Second, convert it back into audio so you can listen to it while driving. Third, if you have screen reader installed on your computer or laptop then just simply convert it into audio and listen to it later while relaxing on the couch or at home! Finally, let's look at some things that are very important when producing braille for yourself for any purpose.
